

Solution for Micro Grid

Verdek has extensive experience in deploying highly efficient and integrated microgrids. We specialize in designing and implementing low-cost software solutions that result in efficient operations when your power needs change.

Insurance Against the Elements

Many US cities and towns lost electricity for several days after Hurricane Irene and Sandy. Microgrids can use solar panels, energy storage such as batteries, and conventional generators in a unique and independent environment to provide clean power to critical buildings such as:

Hospitals	Schools	Police Stations
Disaster Centers	Fire Stations	Sanitation Departments

Remote Monitoring

Included with our microgrid solution is 24/7 remote energy monitoring and support, allowing you to keep tabs on your available power and usage. Using a cloud-based software called EnergyScope, our microgrid platform is the industry’s most advanced and smart distributed energy resource management system that allows for on-the-go visibility and control.
